

Saving lives is a very serious business

Under Vehicle Inspection

Spector™ is used at roadside, embassy, border, or secure location checkpoints to inspect the underside of vehicles for bombs, weapons, contraband, or other suspicious objects.

Surveillance and Reconnaissance

Autonomous Solutions' under vehicle inspection system, Spector™, is an omnidirectional platform designed to perform under-vehicle visual inspections for explosives, weapons, or other contraband while keeping inspectors out of harm's way.

The Spector™ platform is smaller, lighter, lower in cost, and performs better on sandy, soft, and rough surfaces than the conventional platforms. Spector™ also features easy field service and repair as well as space and connections for easy addition of more extensive sensors for detecting explosives or WMD.
